

PRODUCT PRESENTATION

PPM30 A

Pure Micronized Propolis for Food 30 % of active ingredients

This powder is made from the EADP (Dense Alcoholic **Propolis** Extracts) which is absorbed by an organic cornstarch base (patented). The resulting substance is then dried at low temperature and ground to give a very fine, light, beige colored powder with a pleasant balsamic fragrance. The starch, highly active in **Propolis**, turns this waxy substance into one that is easily absorbed by the body.

The PPM30A, despite its high concentration in active ingredients (30 % of E.M.P. = Soft **Propolis** Extracts), can easily be dissolved in water.

From a therapeutical point of view, it is highly beneficial as the active ingredients of the **Propolis** are easily absorbed by the body and especially by the mucous membranes.

From a technical point of view, although it is rich in soft extracts (i.e. waxy and balsamic substances), the PPM30A does not become lumpy. However, it is advised to keep it in a cool place (10° to 15°).

This fluidity makes it ideal for products like capsules, tablets etc, as it does not clog the equipment. This PPM is therefore ideal for all dry mixtures.

This PPM can be used in a wide range of applications (food industry, veterinary industry, pharmaceutical industry...).
